

Important facts about management groups

- A single directory can support 10,000 management groups.
- A management group tree can support up to six levels of depth.

This limit doesn't include the root level or the subscription level.
- Each management group and subscription can support only one parent.
- Each management group can have many children.
- All subscriptions and management groups are within a single hierarchy in each directory. For more information, see [Important facts about the root management group](#) later in this article.

Important facts about the root management group

- By default, the root management group's display name is **Tenant root group**, and it operates itself as a management group. The ID is the same value as the Microsoft Entra tenant ID.
- To change the display name, your account must have the Owner or Contributor role on the root management group. For more information, see [Change the name of a management group](#).
- The root management group can't be moved or deleted, unlike other management groups.
- All subscriptions and management groups fold up into one root management group within the directory.
 - All resources in the directory fold up to the root management group for global management.
 - New subscriptions automatically default to the root management group when they're created.
- All Azure customers can see the root management group, but not all customers have access to manage that root management group.
 - Everyone who has access to a subscription can see the context of where that subscription is in the hierarchy.
 - No one has default access to the root management group. Microsoft Entra Global Administrators are the only users who can elevate themselves to gain access. After they have access to the root management group, they can assign any Azure role to other users to manage the group.
